Ethereum's Post-Merge Supply Dynamics and Monetary Premium

Data-forward assessment for crypto-native investors and ecosystem participants

Total Supply	ETH Price	7D Net Supply Change
121.60M	$2,243	+19,445.89
ETH	USD	ETH (+0.83%/yr)

Post-Merge Context

- Validator-driven PoS issuance replaces PoW structural sell pressure.
- EIP-1559 burn can offset issuance only when on-chain demand is sustained.
- Current gas regime (0.1 Gwei avg) implies weak burn and mild inflation.

Supply Change Snapshot: Issuance Dominates Burn

Key Read

Over the trailing 7 days, issuance far exceeded burn, producing net supply expansion.

Burn Offset Ratio

0.01x

- Annualized supply growth: +0.83%/year
- 7-day burn record: 0.07 ETH/block
- Burn offsets only ~1% of issuance

7-Day ETH Flow (Bar/Waterfall View)

Why Burn Is Weak: Historically Low Gas and Fee Throughput

Gas Regime (7D)

Min: 0.0 Gwei

Max: 1.3 Gwei

Average: 0.1 Gwei

Conclusion: demand is too weak to sustain meaningful burn.

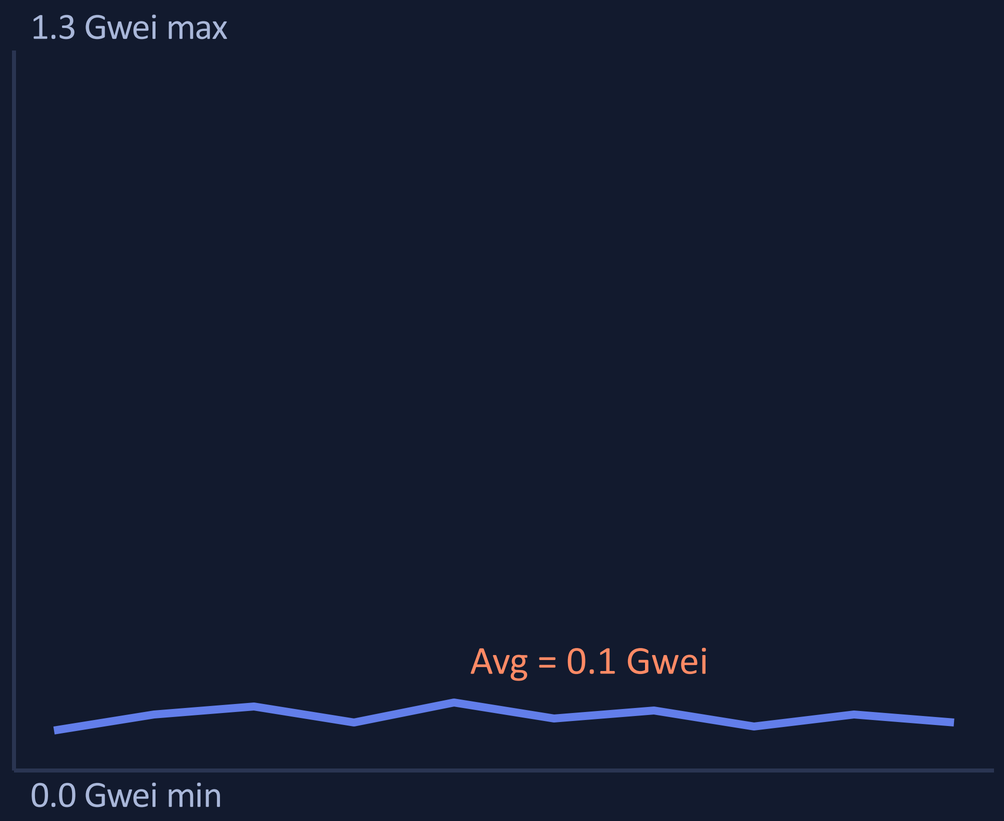
Blob Fee Environment

Avg blob gas: 7,144,934 wei

Blob burn (7D): 0.15 ETH ($319)

Recent blocks: 0.00–0.01 ETH burn each

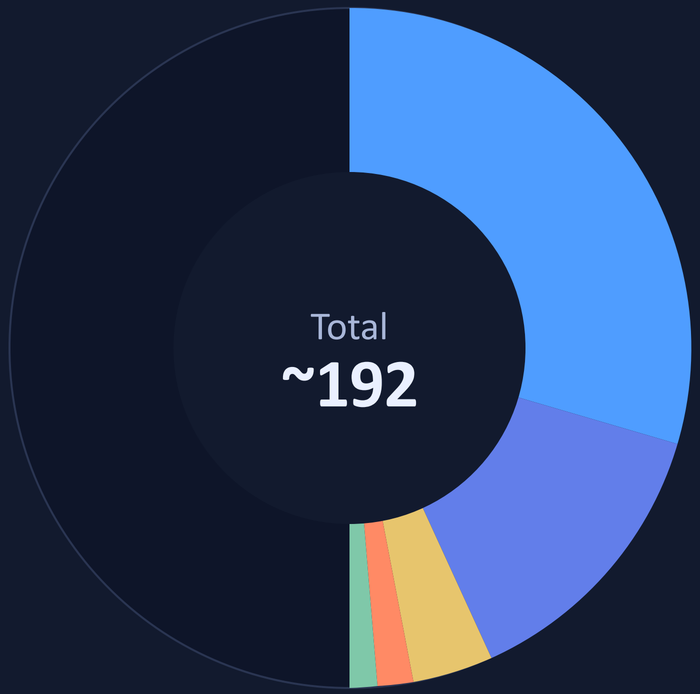
Compressed Gas Range (Illustrative Micro-Chart)



Source: ultrasound.money (as provided in brief)

Burn Composition: Dominated by DeFi and ETH Transfers

7-Day Burn Category Mix (ETH)



DeFi + ETH transfers account for most burn, but absolute burn remains low

Category and Leaderboard Detail

DeFi: 31 ETH

ETH transfers: 22 ETH

Misc: 4 ETH

NFTs: 3 ETH

Contract creations: 2 ETH

L2: 0 ETH

MEV: 0 ETH

Blob fees: 0 ETH

Leaderboard Highlights

ETH transfers: 21.74 ETH burned

Tether USDT: 13.55 ETH burned

Source: ultrasound.money (as provided in brief)

Staking Economics: Significant Supply Lock, Modest Real Yield Mix

Scarcity Engine

38.9M

ETH staked (~32% of supply)

9.1M ETH locked in staking contracts

Average time span: 10.7 years

PoS issuance: ~2,800 ETH/day

Burn (normalized assumption):

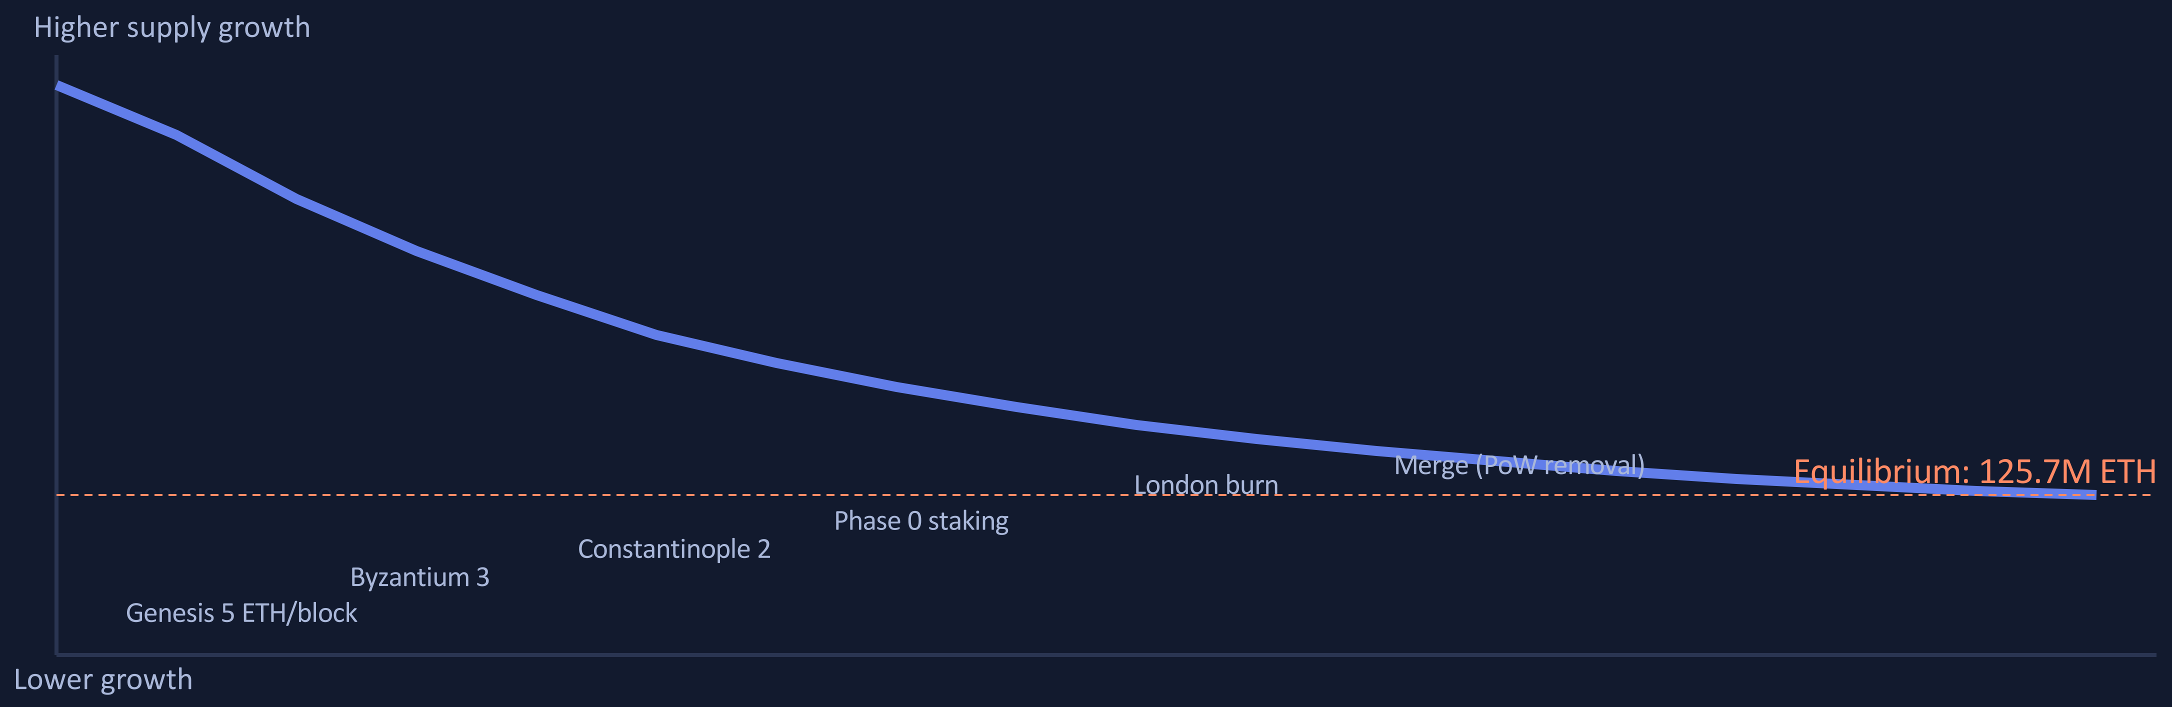
~2,200 ETH/day

Validator Reward Stack

Issuance	0.9 ETH/validator	2.7%
Tips	0.0 ETH	0.1%
MEV estimate	0.0 ETH	0.1%
Total Validator APR		**~2.9%**

Source: ultrasound.money (as provided in brief)

200-Year Supply Projection: Convergence Toward 125.7M ETH Equilibrium



Staked Assumption

39M ETH

Base Gas Assumption

22 Gwei

PoS Issuance

2.8K ETH/day

Burn (assumption)

2.2K ETH/day

Key Takeaways: Thesis Intact, Activity Is the Critical Variable

Ultra sound money is structurally credible, but cyclically dependent on gas activity.

1) Current State

ETH is mildly inflationary at +0.83%/yr due to 0.1 Gwei average gas.

2) Burn Mechanics

EIP-1559 works, but requires sustained on-chain activity to offset issuance.

3) Staking Lock

38.9M ETH staked (~32% of supply) reinforces long-duration scarcity.

4) Long-Term Path

Model converges toward 125.7M ETH equilibrium under 39M staked / 22 Gw

5) Monetary Premium Traction

ETH at 18.7% of BTC market cap and securing ~$307.6B indicates growing, still early monetary premium.
