

State of the Web 2020–2025

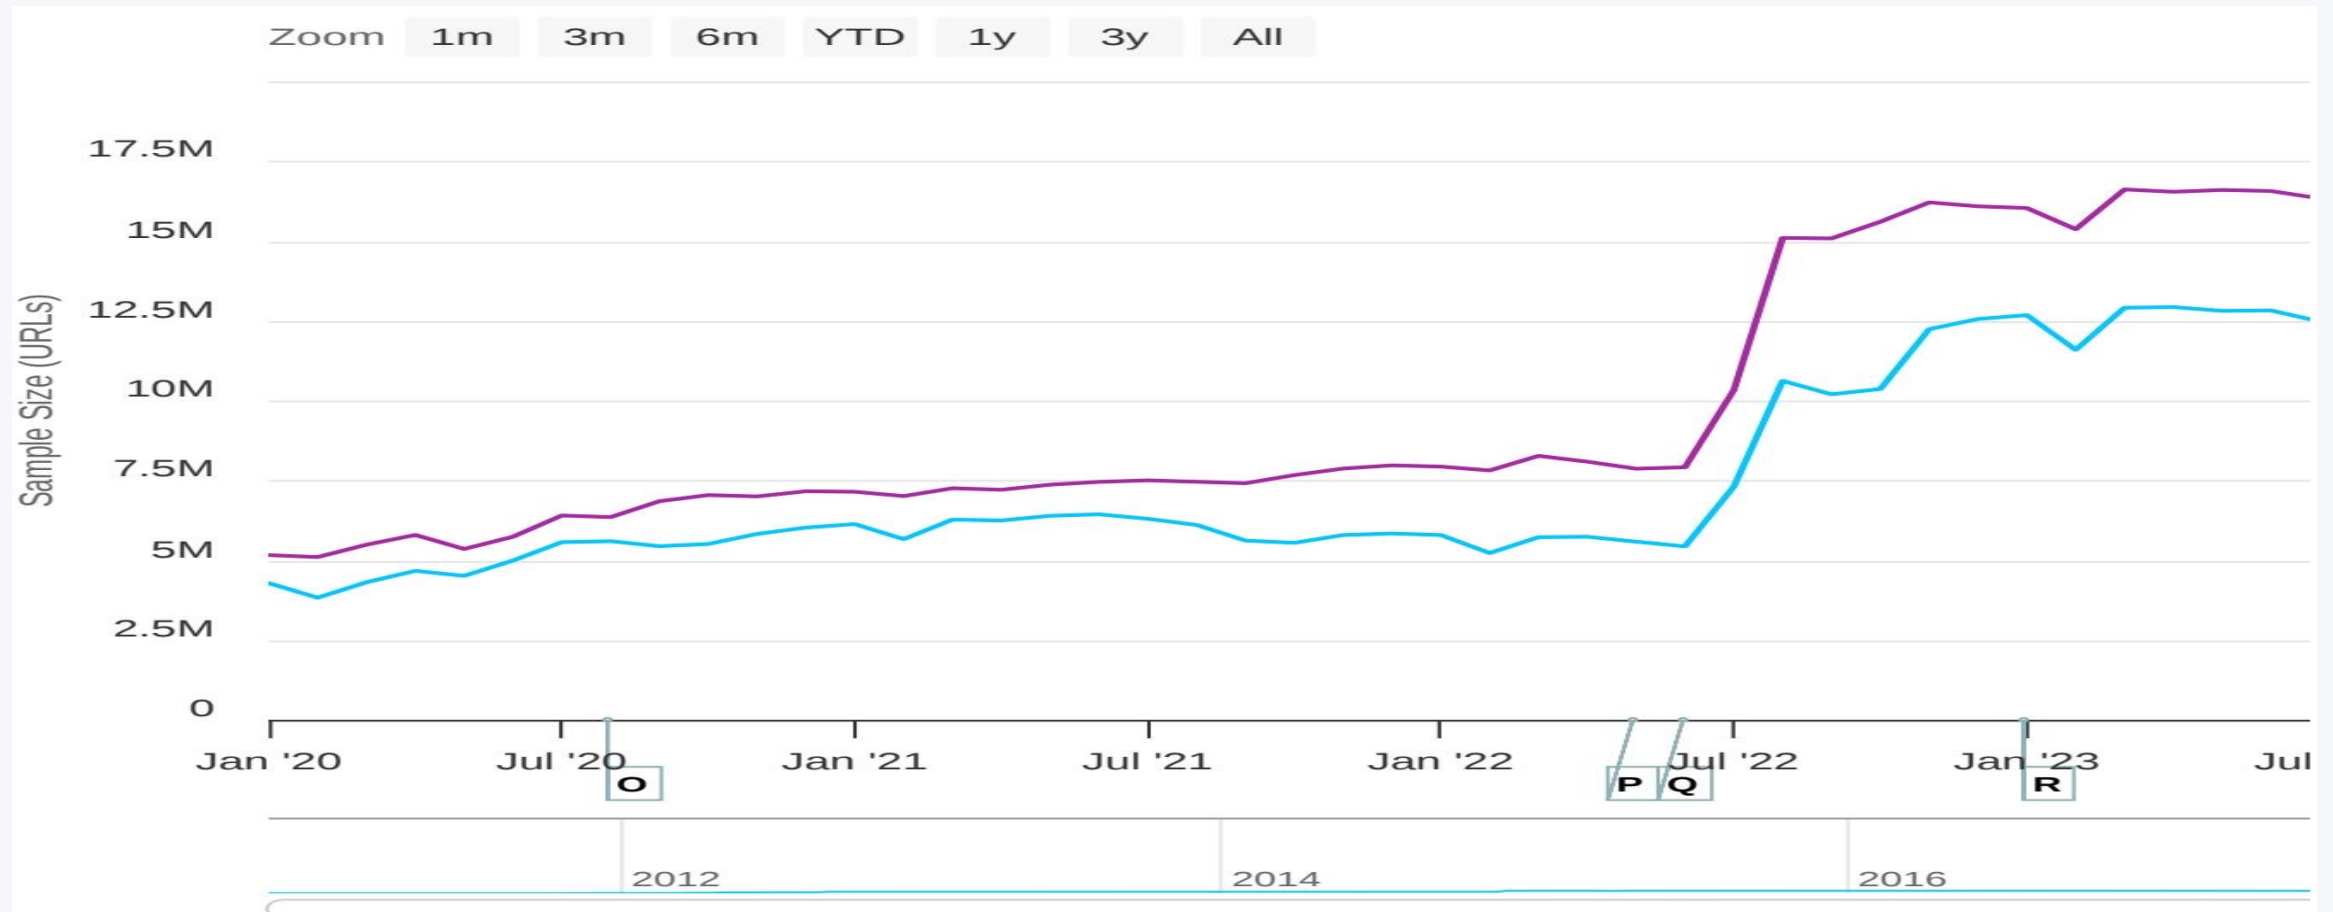

HTTP Archive — State of the Web report • Jan 2020 – Mar 2026

Trends in crawl scale, page weight, request patterns, protocols, and security — built for performance engineers and front-end architects

Source: HTTP Archive — State of the Web

Crawl Sample Size Tripled

Desktop ~5M → ~16M URLs; Mobile ~3.5M → ~12.5M (Jan 2020 – mid-2023 plateau)

Median Page Weight Climbs to ~2,000 KB (Desktop)

Desktop median ~1,600 KB → ~2,000 KB since early 2020; mobile tracks slightly lower

Context: 75th-percentile desktop page exceeds 4,000 KB (long tail).
Source: HTTP Archive State of the Web (figure_2)

Requests and Connections

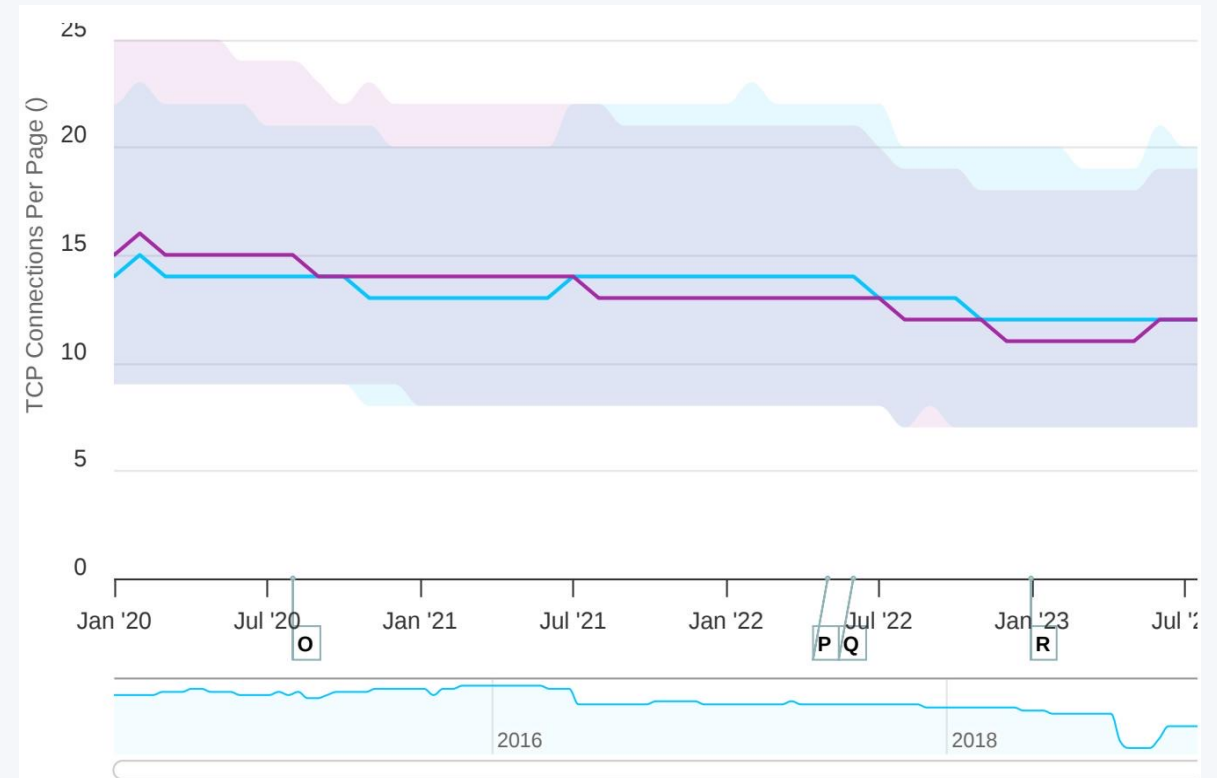

More resources per page, fewer TCP connections — consistent with multiplexing

76

Median requests per desktop page (mobile: 71)
Up ~2.7% desktop / ~2.9% mobile

12.0

Median TCP connections per desktop page
Down from ~15 (early 2020); mobile now 11.0

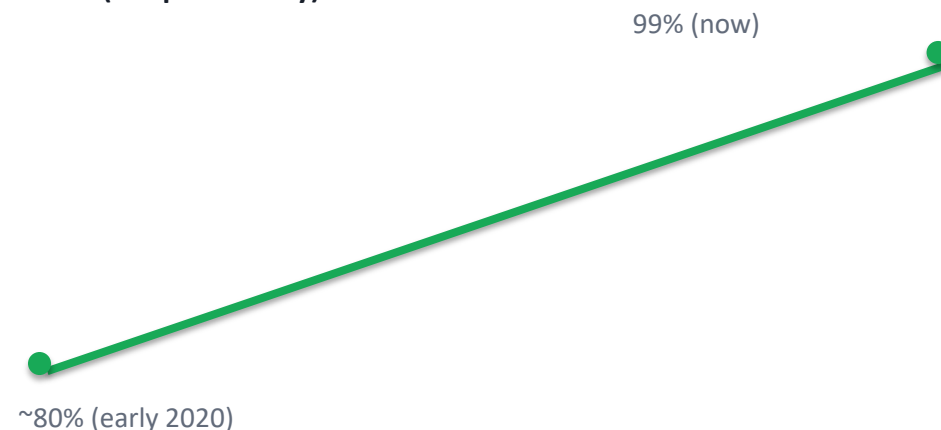

HTTPS Requests Reach 99%

Encryption is now the default for page subresources

99%+

HTTPS share of requests
Desktop: 99.2% • Mobile: 99.1%

Trend (endpoints only)

Increase of ~19–20 percentage points since early 2020 — plaintext HTTP is effectively gone.

HTTP/2 vs HTTP/3: Flat vs. Explosive Growth

HTTP/2 steady near ~58% while HTTP/3 support surges to ~40%

58.6%

HTTP/2 share of desktop requests
Mobile: 57.6%

38.7%

HTTP/3 support (desktop)
Mobile: 40.0% (near-zero baseline in 2020)

Interpretation notes

HTTP/2 growth modest (1–3% recently) as HTTP/3 absorbs new adoption.

HTTP/3 measured as support, not usage: fresh Chrome instances start with HTTP/2, then discover Alt-Svc.

Benchmark: validate server and CDN QUIC readiness; test real-user enablement separately.

Font-Display Adoption: 40–42% (Still Room to Grow)

Using font-display reduces FOIT risk during web font loading

40.1%

Desktop pages using font-display (Lighthouse)

42.5%

Mobile pages using font-display
Up 61.0% since 2020

Why it matters

Helps avoid Flash of Invisible Text (FOIT) by controlling font rendering behavior.

More than half of pages still risk FOIT — low-effort, high-impact best practice.

Key Takeaways

Benchmark your sites against these baselines and track drift over time.

Page weight keeps climbing: median desktop ~2,000 KB (~25% heavier than 2020).

HTTPS is the baseline: 99.2% desktop / 99.1% mobile requests are encrypted.

HTTP/3 is the fastest-growing metric: ~38.7% desktop / 40.0% mobile support from near-zero in 2020.

Fewer TCP connections despite more requests: median connections down to 12.0 desktop / 11.0 mobile.

Font-display is underused: 40.1% desktop / 42.5% mobile — still >50% risk FOIT.
