

State of the Web 2020–2025

HTTP Archive Trends in Page Weight, Protocols, and Security

A data-driven overview for web performance engineers and front-end architects evaluating infrastructure trends.

DATA SOURCE

HTTP Archive

State of the Web Report

TIME RANGE

Jan 2020–Mar 2026

Desktop and mobile crawls

SCOPE

Millions of URLs

Page weight, protocols, security

Crawl Sample Size Tripled: From ~5M to 16M Desktop URLs Since 2020

HTTP Archive sample size, desktop vs. mobile

DESKTOP CRAWL

~5M → 16M
Jan '20 to current plateau

MOBILE CRAWL

~3.5M → 12.5M
Stabilized by mid-2023 onward

Sharp jump around mid-2022: desktop ~15M and mobile ~10M URLs.

Post-2023 plateau improves trend comparability at much larger scale.

Interpret five-year changes with awareness of crawl expansion.

Median Page Weight Climbs Steadily to ~2,000 KB on Desktop

DESKTOP MEDIAN

~2,000 KB

From ~1,600 KB in early 2020

MOBILE MEDIAN

~1,900 KB

Tracks slightly lower

DESKTOP 75TH PCT.

>4,000 KB

Long tail of heavy pages

Median total transfer size is up ~25% on both desktop and mobile.

The upper quartile highlights persistent variance beyond the median.

76 Requests per Desktop Page While TCP Connections Drop to 12

Total requests per page — median

DESKTOP

76

▲ 2.7%

MOBILE

71

▲ 2.9%

Request counts are modestly higher over the observation period.

Efficiency gains come from serving more requests over fewer TCP connections.

Multiplexing effect: HTTP/2 and HTTP/3 reduce connection pressure even as pages make more requests.

TCP connections per page decline from ~15 to 12 desktop / 11 mobile

HTTPS Requests Reach 99%: Encryption Is Now the Default

HTTP/2 Holds at ~58% While HTTP/3 Support Surges to 40%

Latest protocol snapshot

图表标题

HTTP/3 support trajectory

HTTP/2: 58.6% desktop / 57.6% mobile requests.

HTTP/3 support: 38.7% desktop / 40.0% mobile.

HTTP Archive measures HTTP/3 support, not actual usage, because fresh Chrome instances discover capability via Alt-Svc.

Font-Display Usage Reaches 42% on Mobile, Up 61% Since 2020

Current Lighthouse-measured `font-display` adoption

DESKTOP ADOPTION

40.1%

Up 14.9% since 2020

MOBILE ADOPTION

42.5%

Up 61.0% since 2020

Why it matters

`font-display` helps avoid Flash of Invisible Text during web font loading.

More than half of pages still risk FOIT despite growth in adoption.

Optimization opportunity: audit font loading policy alongside critical rendering path and Core Web Vitals work.

Key Takeaways: Bigger Pages, Smarter Protocols, Stronger Security

01

Page weight keeps climbing

Median desktop pages now transfer ~2,000 KB, roughly 25% heavier than in 2020.

02

HTTPS is the new baseline

99.2% desktop and 99.1% mobile requests use HTTPS.

03

HTTP/3 is moving mainstream

Support reached 38.7% desktop and 40.0% mobile from a near-zero baseline.

04

Connections are declining

Median TCP connections fell to 12 desktop and 11 mobile despite request growth.

05

Font-display remains underused

40.1% desktop and 42.5% mobile adoption leaves substantial FOIT risk.

Call to action: benchmark your site portfolio against these HTTP Archive baselines before prioritizing infrastructure and front-end optimization work
