

State of the Web 2020–2025: HTTP Archive Trends in Page Weight, Protocol

HTTP Archive dataset | Time range: Jan 2020 – Mar 2026

A data-driven overview of web infrastructure trends for performance engineering.

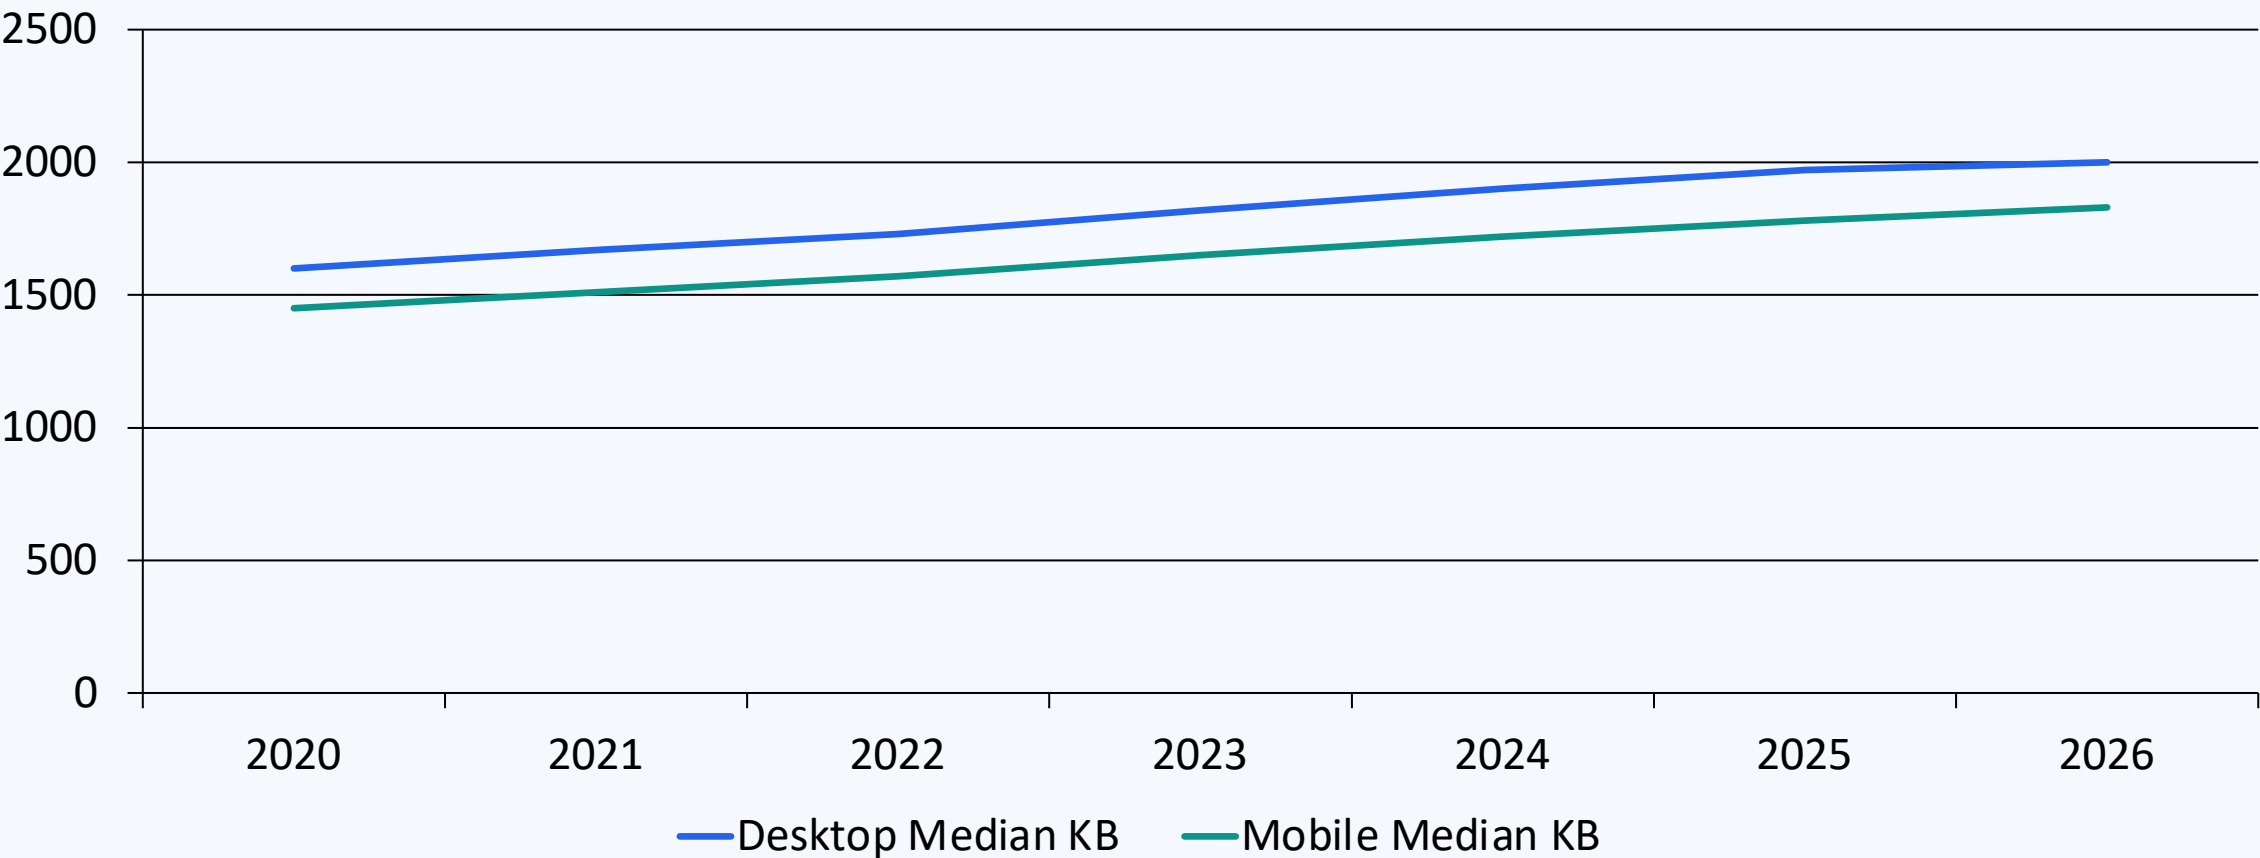

Audience: web performance engineers and front-end architects

Crawl Sample Size Tripled: From ~5M to 16M Desktop URLs Since 2020

Desktop now ~16M URLs and mobile ~12.5M, with a sharp scale-up around mid-2022 and recent plateau.

Median Page Weight Climbs Steadily to ~2,000 KB on Desktop

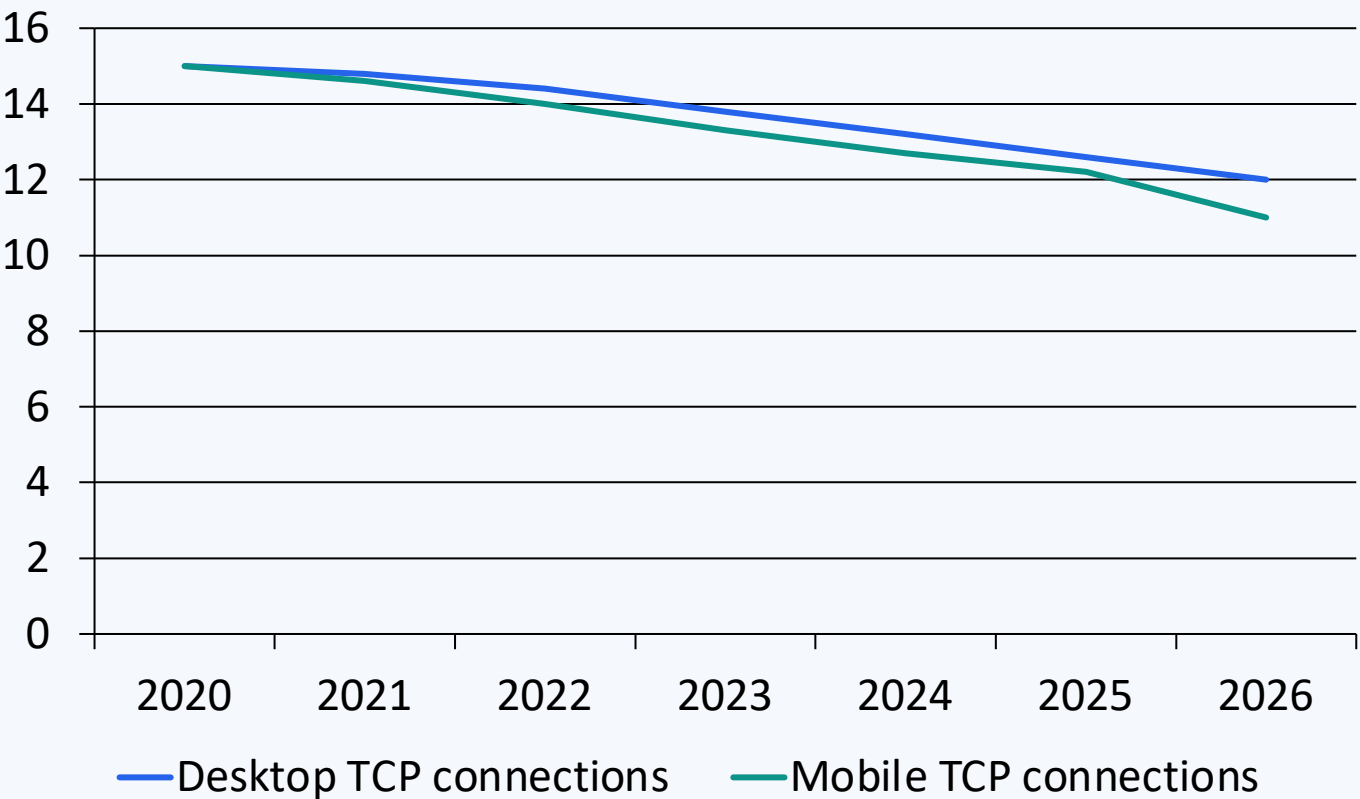

76 Requests per Desktop Page While TCP Connections Drop to 12

Requests / Page

Desktop: 76

Mobile: 71

Both up ~3% vs 2020

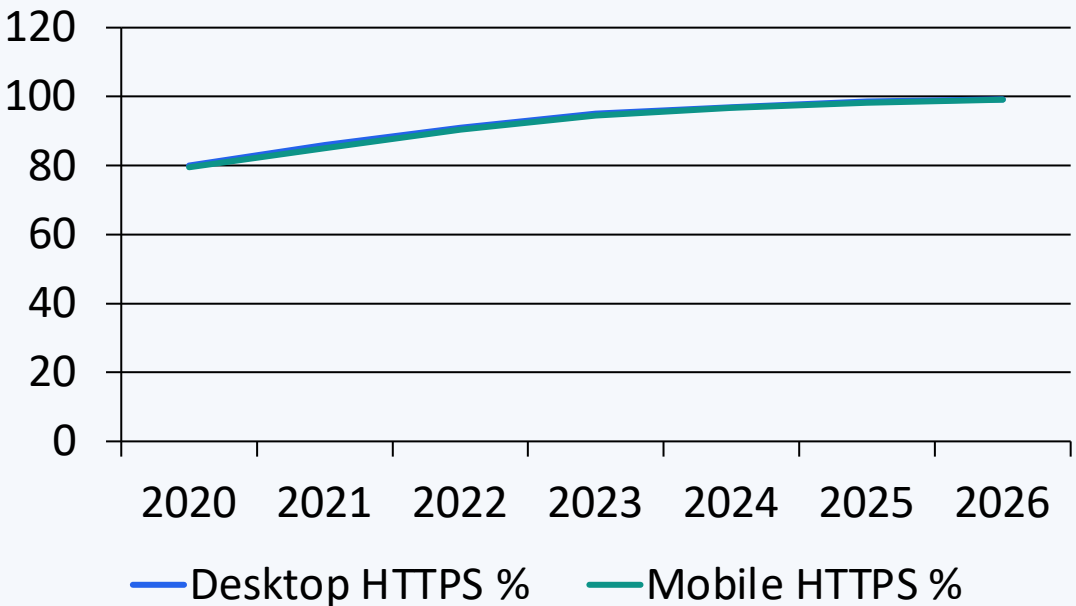

HTTPS Requests Reach 99%: Encryption Is Now the Default

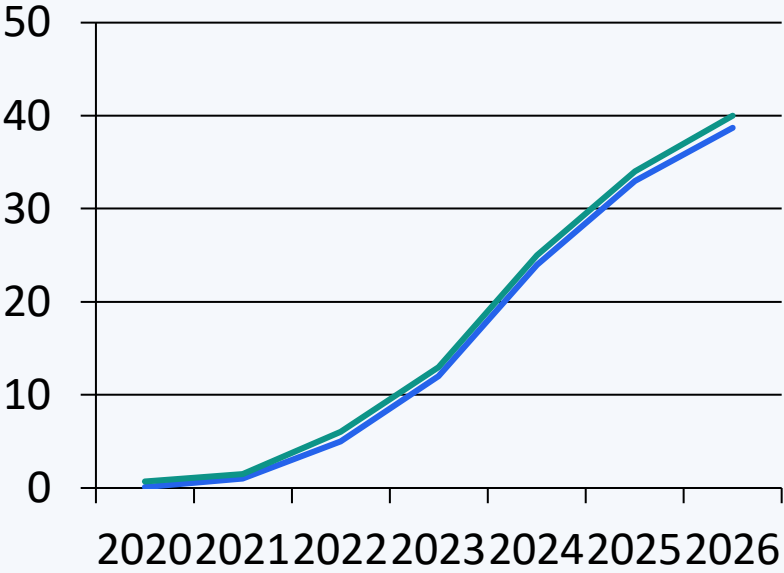

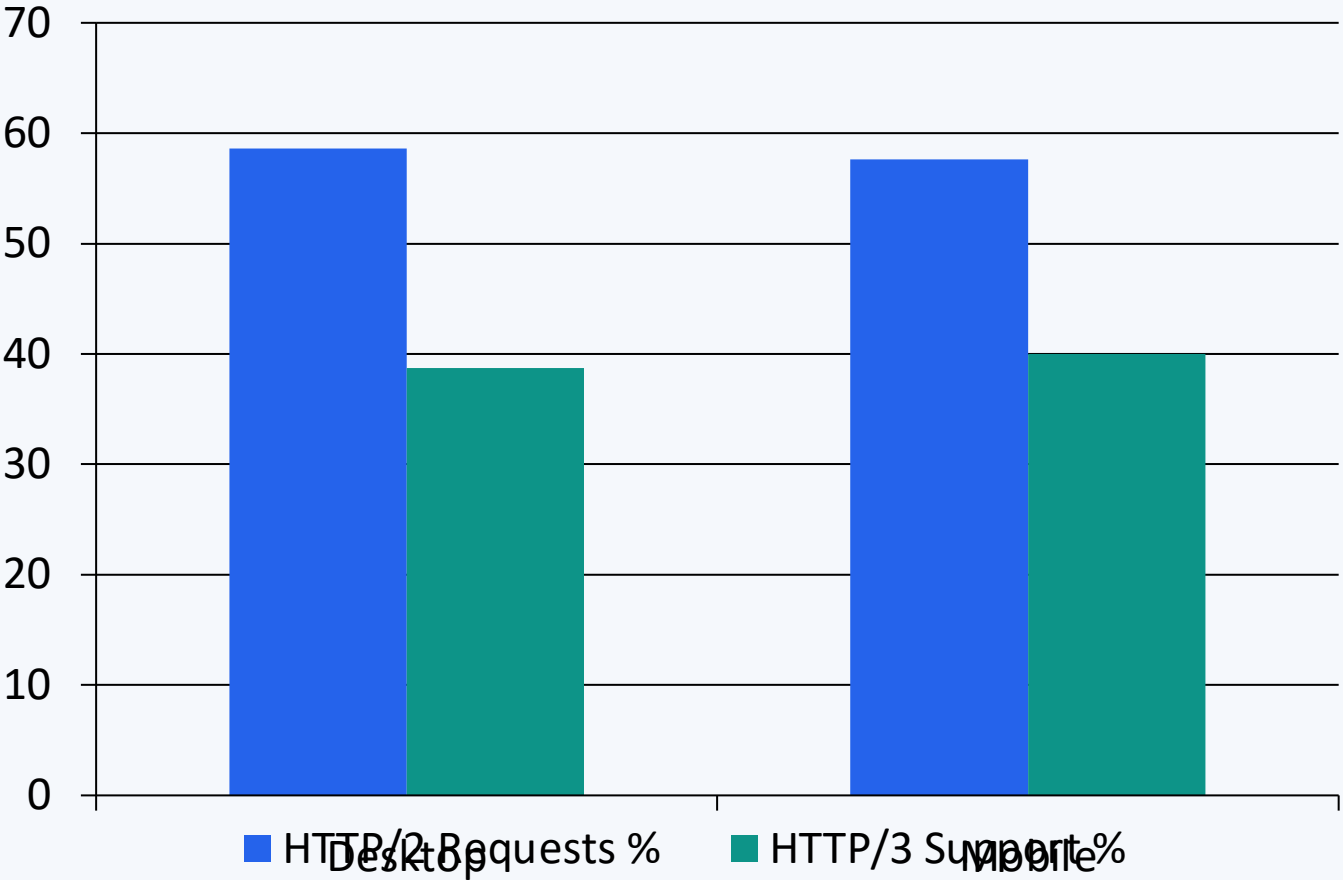

99%+

HTTPS requests

Desktop 99.2% | Mobile 99.1%

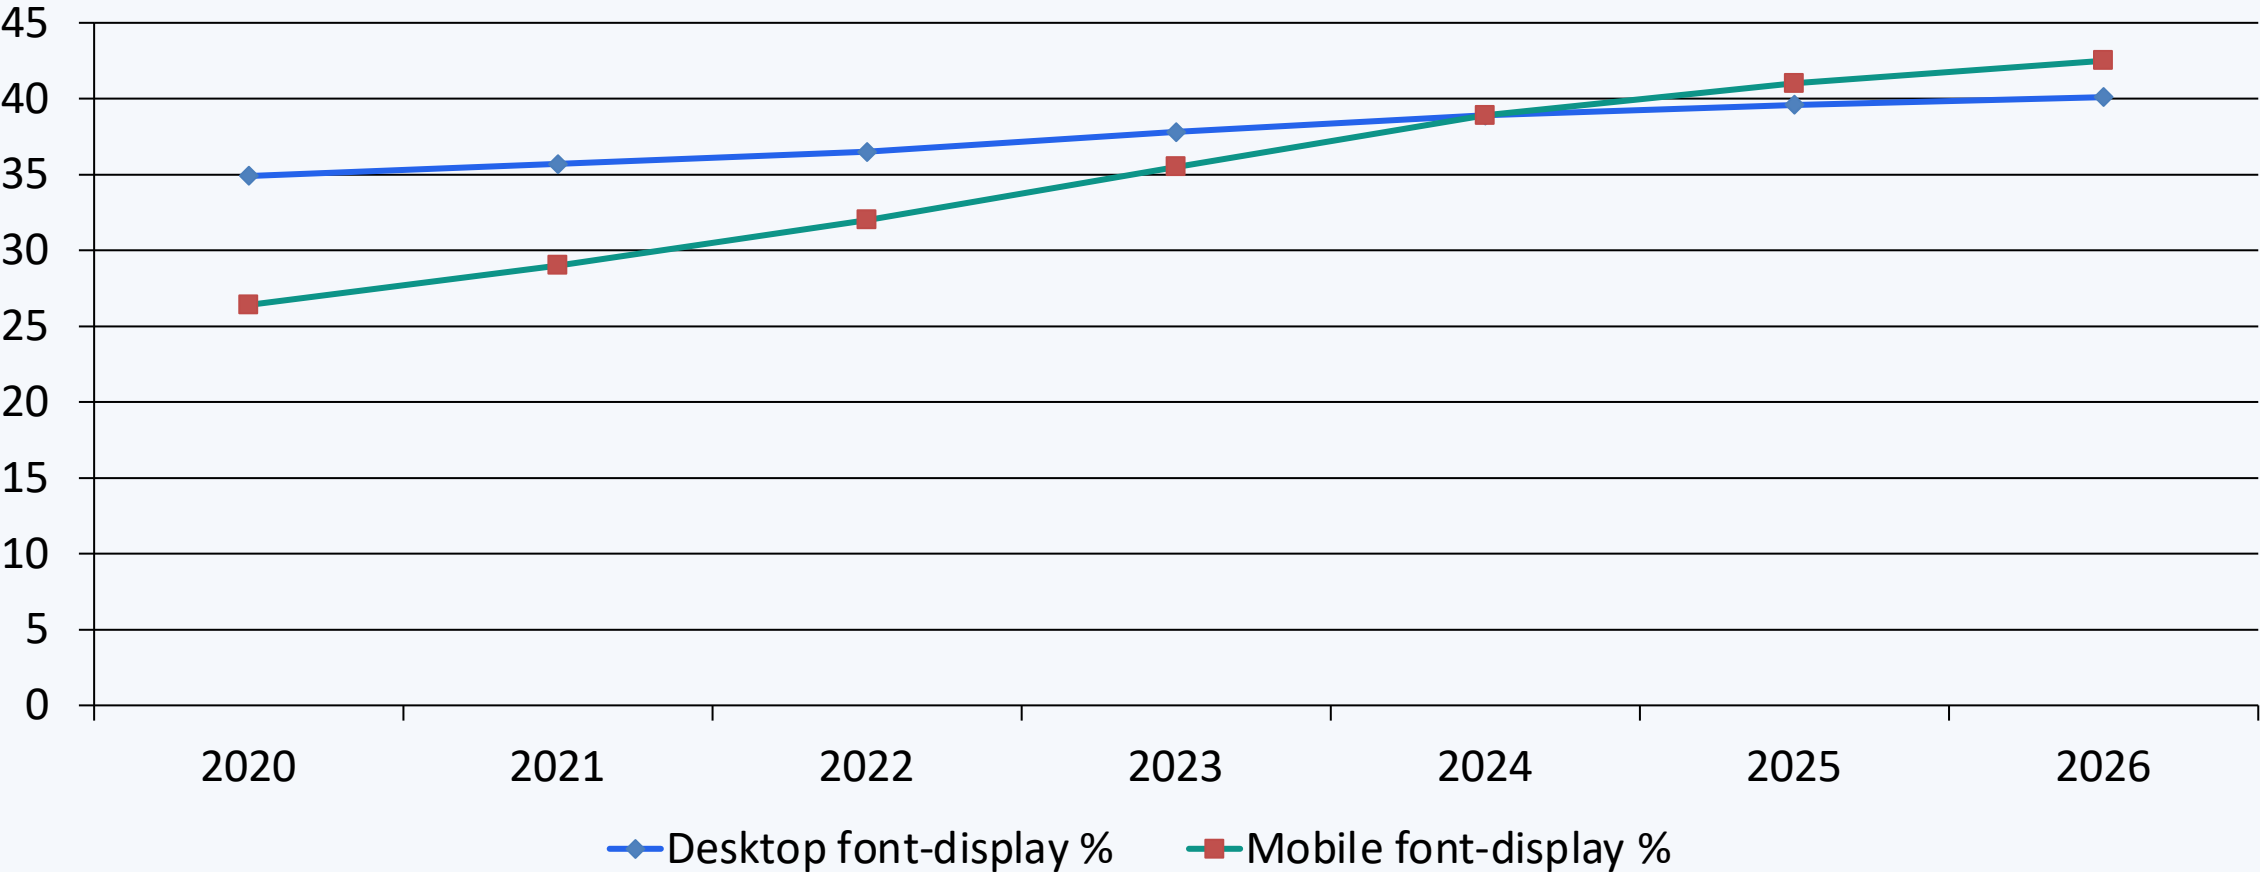

HTTP/2 Holds at ~58% While HTTP/3 Support Surges to 40%

Caveat: HTTP Archive reports HTTP/3 support, not first-visit usage in fresh Chrom

Font-Display Usage Reaches 42% on Mobile, Up 61% Since 2020

Key Takeaways: Bigger Pages, Smarter Protocols, Stronger Security

Page weight keeps climbing: desktop median is now ~2,000 KB (~25% above 2020).

HTTPS is effectively universal: 99.2% desktop and 99.1% mobile requests are encrypted.

HTTP/3 is the fastest-growing protocol metric: now ~39–40% support.

Requests are slightly higher, but TCP connections fell from ~15 to ~12 via multiplexing.

Font-display adoption is improving (40.1% desktop, 42.5% mobile) but still not majority.

Next step: benchmark your own pages against these baselines and prioritize gaps.
