

State of the Web 2020–2025: HTTP Archive Trends in Page Weight, P

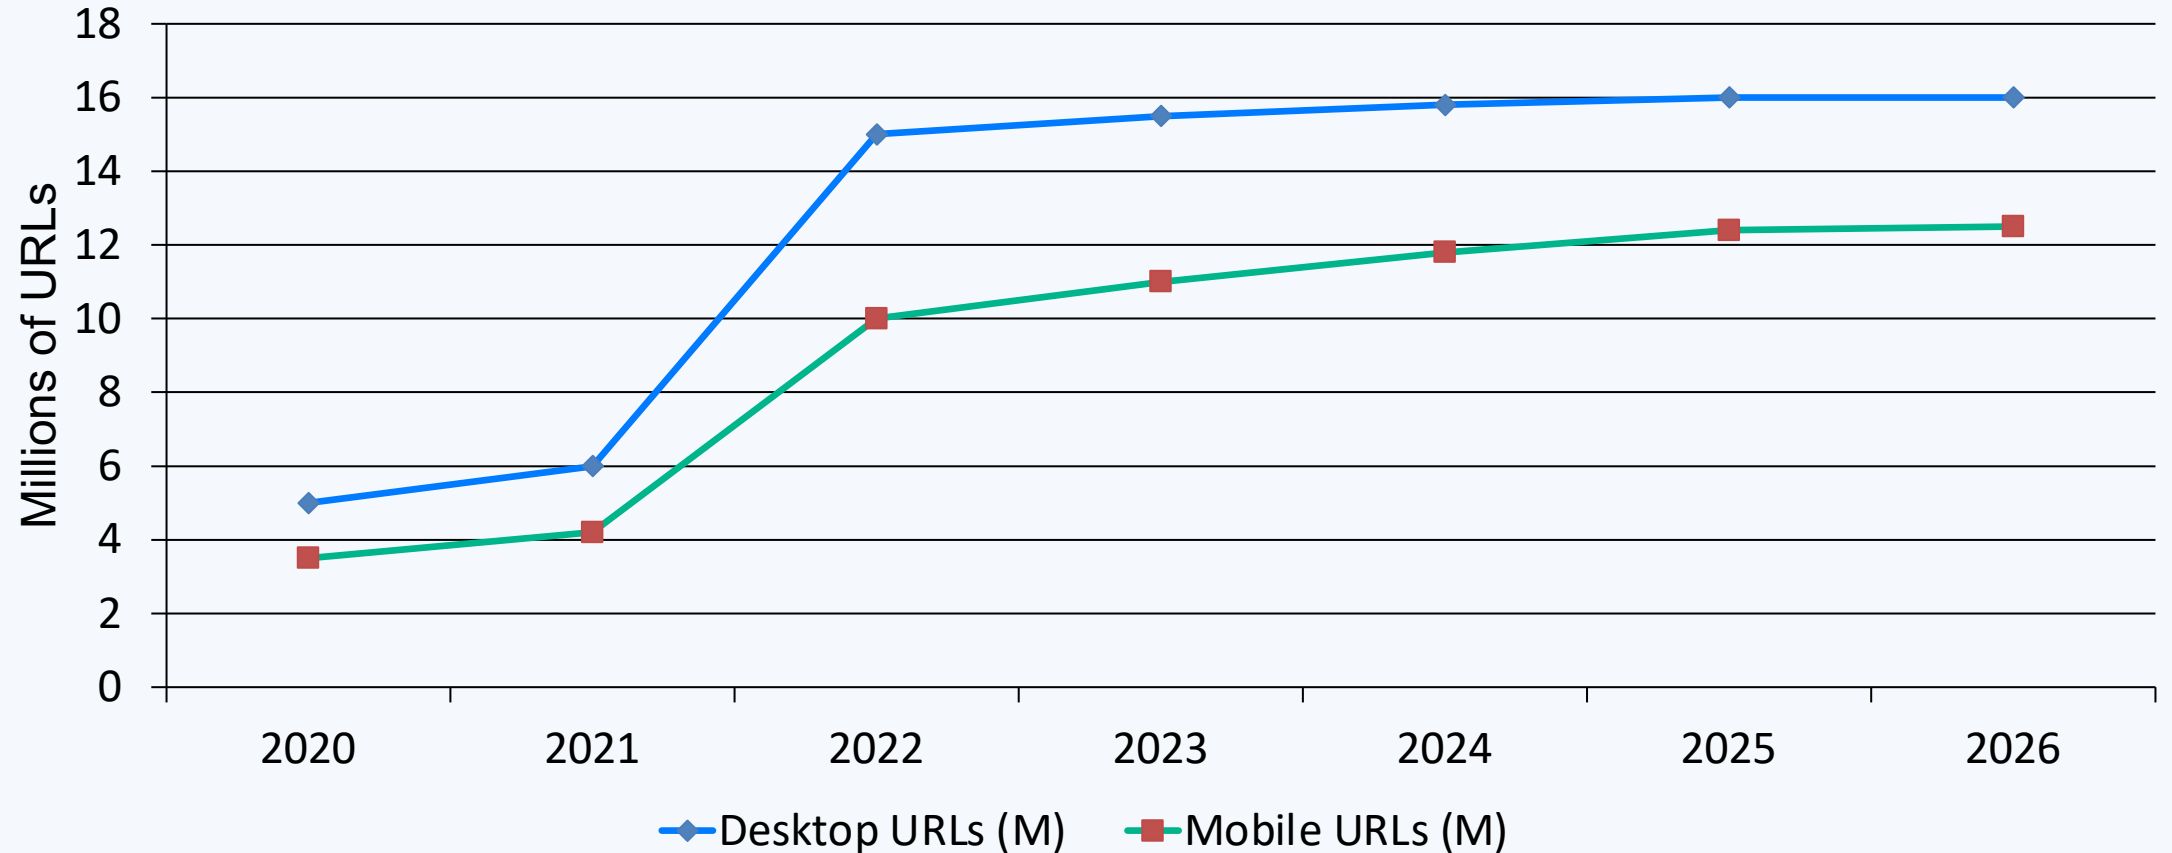

HTTP Archive data source | Time range: Jan 2020 – Mar 2026

Audience: web performance engineers and front-end architects

Data-forward benchmark of macro web platform trends:

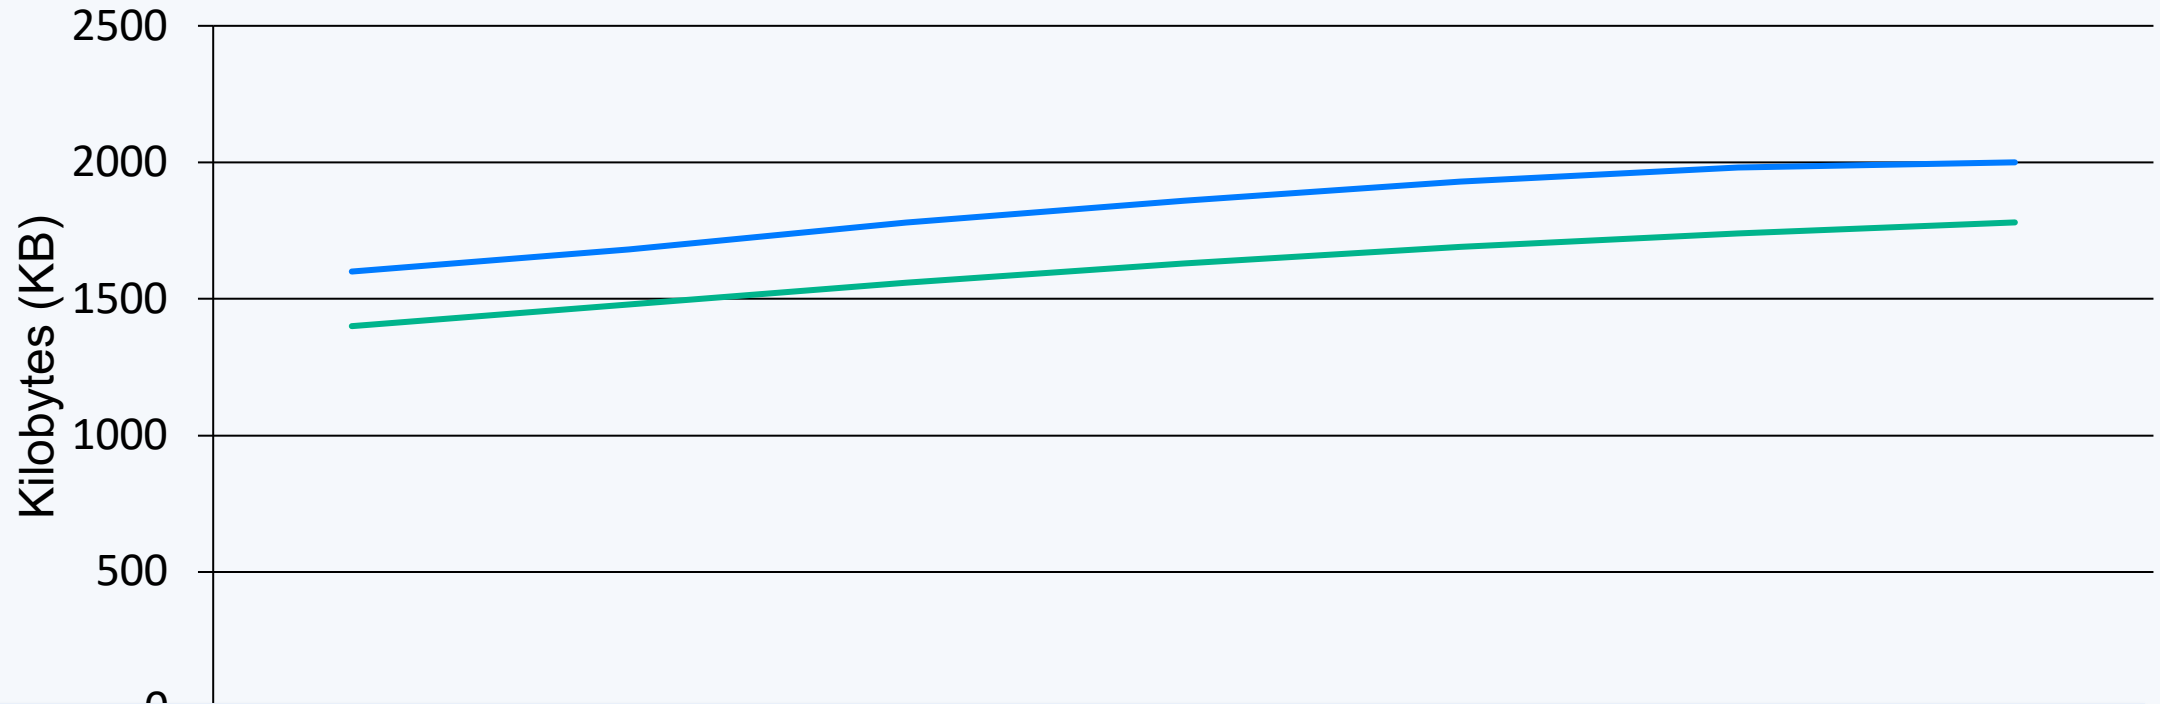

- Crawl sample growth across desktop/mobile
- Rising page weight and request patterns
- HTTPS, HTTP/2, and HTTP/3 protocol trajectory
- Connection efficiency and font-display adoption

Crawl Sample Size Tripled: From ~5M to 16M Desktop URLs Since 2020

Mid-2022 shows the structural step-change; recent values plateau near 16M desktop and 12.5M mobile.

Median Page Weight Climbs Steadily to ~2,000 KB on Desktop

Interpretation: desktop median increased ~25% from ~1,600 KB to ~2,000 KB; mobile follows slightly below desktop.

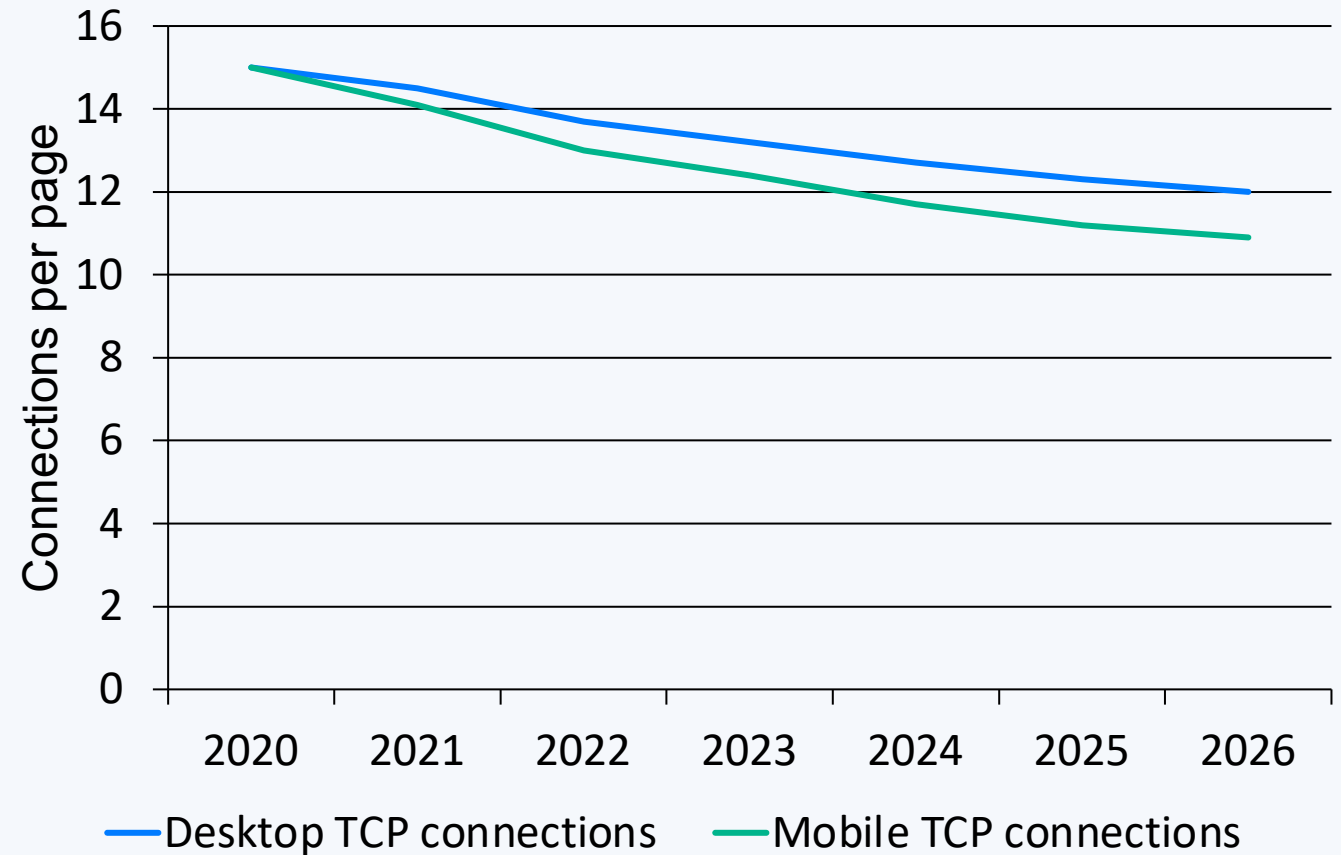

76 Requests per Desktop Page While TCP Connections Drop to 12

Requests per Page

Desktop: 76

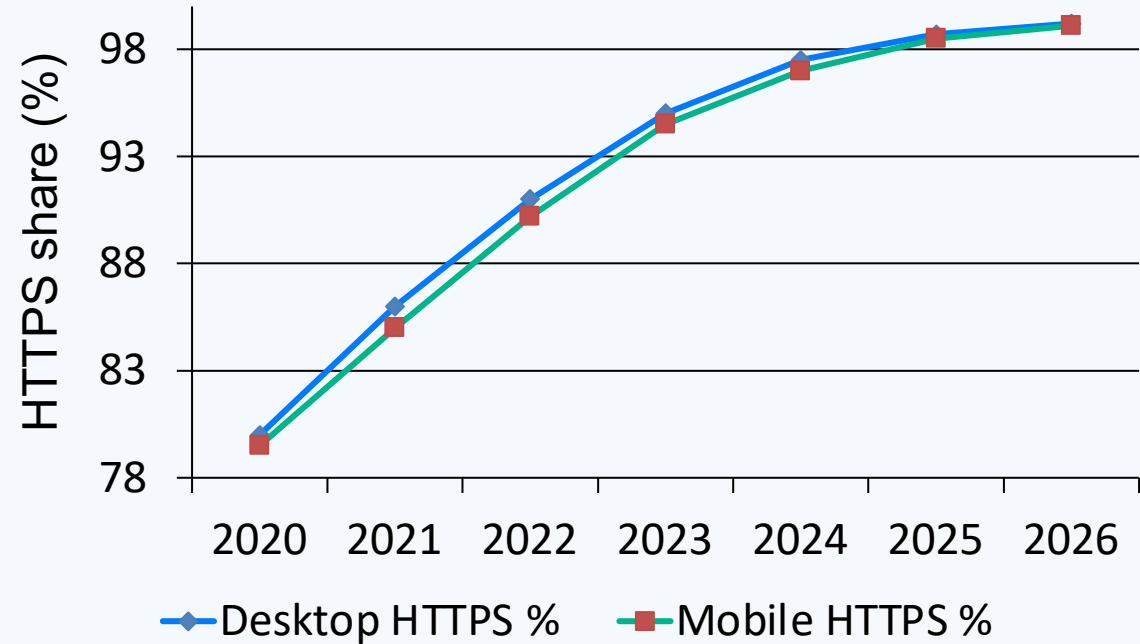

Mobile: 71

Both ~3% higher than 2020

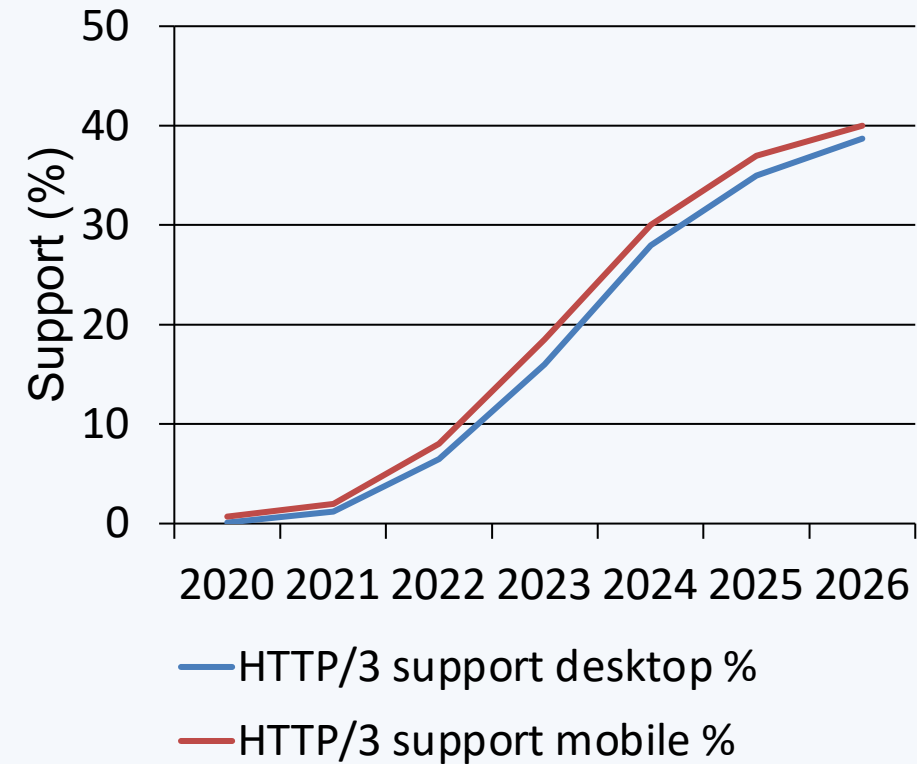

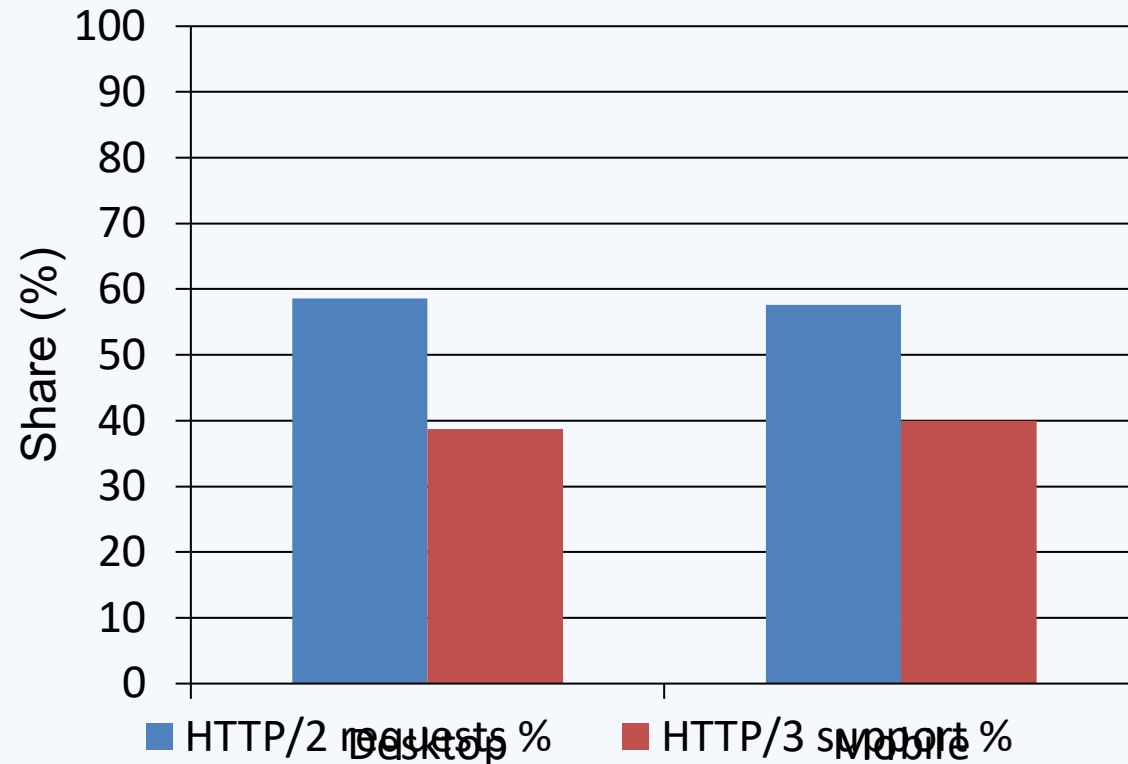

HTTPS Requests Reach 99%: Encryption Is Now the Default

99%+
HTTPS requests
Desktop 99.2% | Mobile 99.1%

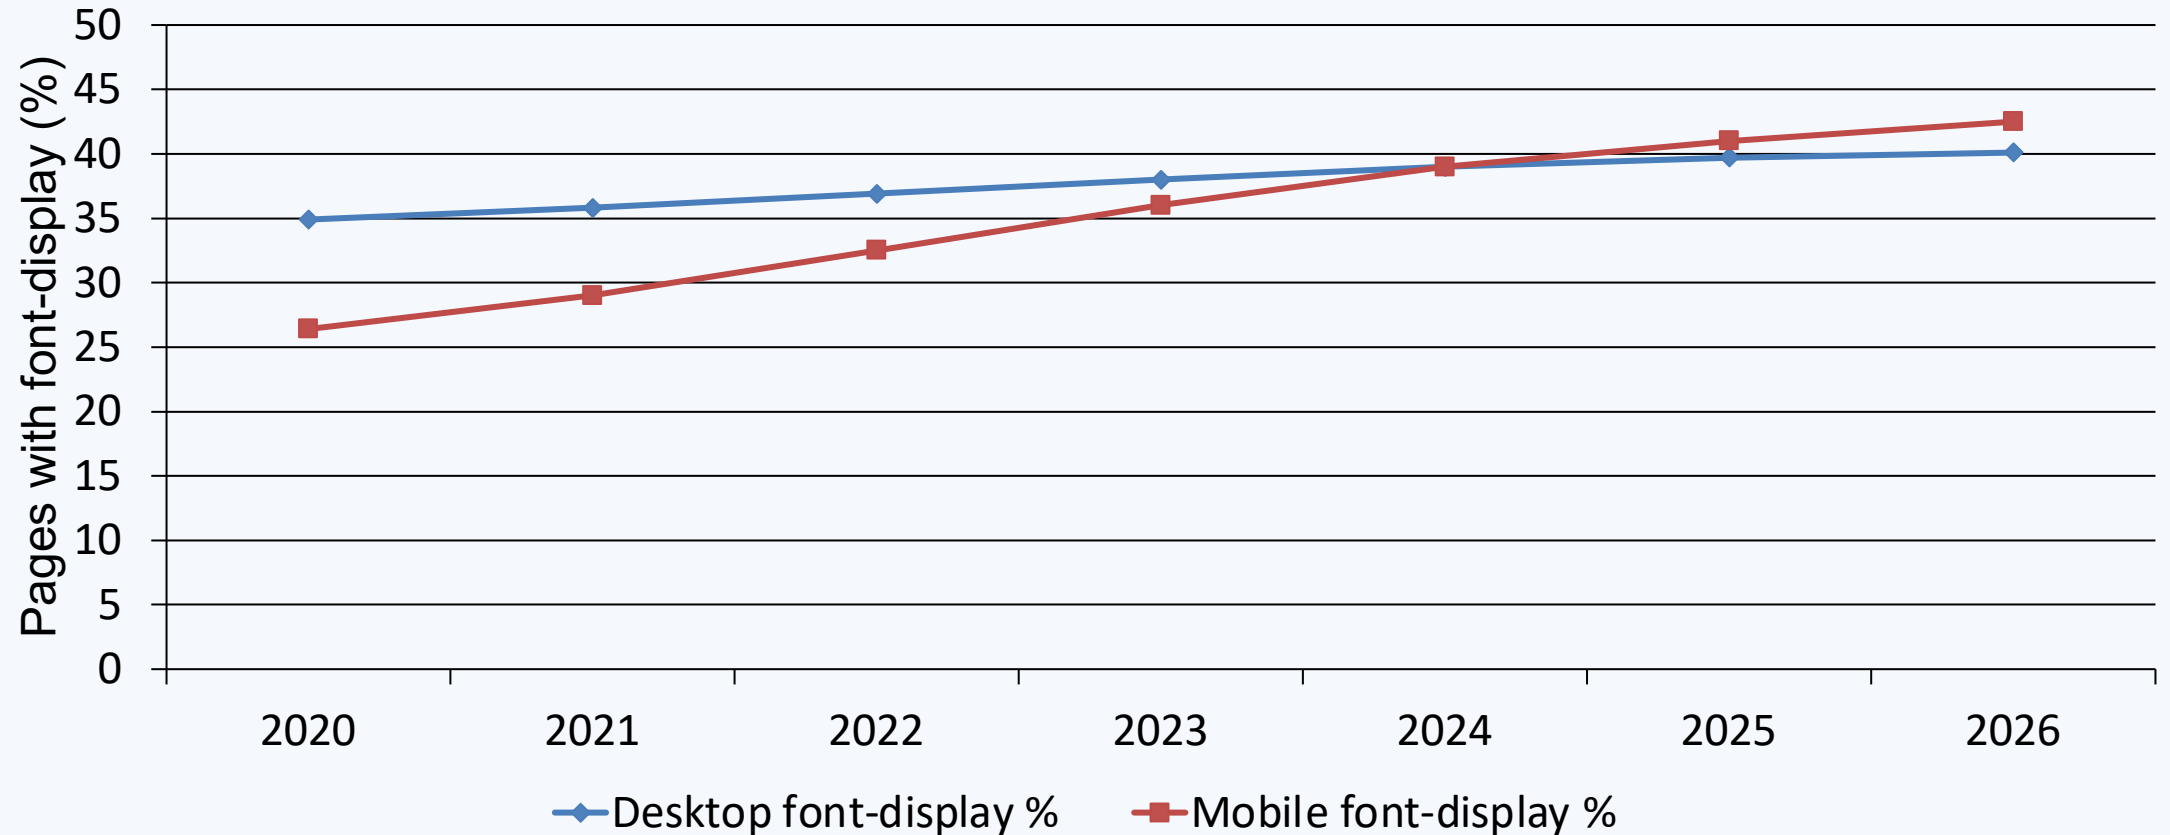

HTTP/2 Holds at ~58% While HTTP/3 Support Surges to 40%

Caveat: HTTP Archive tracks HTTP/3 support (Alt-Svc capability), not first-connection usage in fresh Chrome profiles.

Font-Display Usage Reaches 42% on Mobile, Up 61% Since 2020

FOIT mitigation is improving, but most pages still do not set font-display.

Key Takeaways: Bigger Pages, Smarter Protocols, Stronger Security

- Page weight trend: median desktop transfer rose from ~1,600 KB to ~2,000 KB (~25%).
- Security baseline: HTTPS now covers 99%+ of requests (99.2% desktop, 99.1% mobile).
- Protocol shift: HTTP/2 remains ~58%, while HTTP/3 support accelerated to ~39–40%.
- Efficiency gain: median TCP connections fell from ~15 to ~12 desktop (~10.9 mobile).
- Rendering practice: font-display adoption reached 40.1% desktop and 42.5% mobile; room remains.

Call to action: Benchmark your site against these baselines to prioritize performance and protocol investments.
