

Global CO₂ Emissions: Who Emits, How Much, and What's Changing

Fossil fuels and industry emissions, 1750–2024

Audience: Policy analysts, climate negotiators, and sustainability researchers

Data source: Global Carbon Budget 2025 via Our World in Data

Global CO₂ Emissions Grew from 6 Bt in 1950 to Over 35 Bt Today

Inflection points: slow pre-industrial growth → post-war surge → slower growth in the 2010s/2020s.

Europe and the US Fell from 90% of Emissions in 1900 to Under One-Third Today

Shares are visualized from the provided specification to show direction and scale of the transition in responsibility.

China Now Emits More Than One-Quarter of Global CO₂

Key point

China alone accounts for about one-third of annual global CO₂ emissions in 2024.

Per Capita Emissions Range from 0.1 t in Chad to ~14 t in the US and Canada

Per Capita Emissions Vary Widely: ~14 t in the US vs. ~9 t in China and ~2 t in India

Interpretation

- China is the largest total emitter, but per capita remains below the US.
- India remains low at ~2 t/person.
- Figure_8 context: trajectories diverged over decades.

2024 Snapshot: Many Western Nations Cut Emissions While Parts of Asia and Africa Grew

Diverging bars provide a visual stand-in for the source-described choropleth pattern: blue declines vs red/orange increases.

Energy Mix Explains Why France and the UK Emit Far Less Per Capita Than Germany or the US

Qualitative mechanism

- Similar income levels do not imply similar carbon intensity.
- France, UK, and Portugal emit less per capita than Germany, the Netherlands, or the US.
- A key driver is power-sector composition: higher nuclear/renewables share lowers emissions.
- Policy and infrastructure choices shape long-run outcomes.

Key Takeaways: Responsibility Is Shared but Unequal

- Global emissions exceed 35 Bt/year and have not yet peaked.
-
- China is the largest annual emitter, but its per-capita level remains below the US.
-
- Historical responsibility is still concentrated in Europe and the US.
-
- Per-capita gaps of roughly 150x persist between the highest and lowest emitters.
-
- Energy policy and technology choices can decouple prosperity from emissions.
