

Global CO₂ Emissions: Who Emits, How Much, and What's Changing

Scope: Fossil fuels & industry, 1750–2024

Data: Global Carbon Budget 2025 via Our World in Data

Audience: Policy Analysts, Climate Negotiators, Sustainability Researchers

Global CO₂ Emissions Grew from 6 Bt in 1950 to Over 35 Bt Today

Global CO₂ Trajectory (1750 - 2024)

Europe and the US Fell from 90% of Emissions in 1900 to Under One-Third Today

Regional Share Shift (Stacked Area Representation)

China Now Emits More Than One-Quarter of Global CO₂

Country-Level Shares (Treemap Placeholder)

Per Capita Emissions Range from 0.1 t in Chad to ~14 t in the US and Canada

*Note: There is a 150x gap between the poorest Sub-Saharan African nations and the US/Canada.
(Visual placeholder for World Map / Horizontal Bar)*

Per Capita Emissions Vary Widely: ~14 t in the US vs. ~9 t in China and ~2 t in India

2024 Snapshot: Many Western Nations Cut Emissions While Parts of Asia/Africa Grew

Energy Mix Explains Why France and the UK Emit Far Less Per Capita Than Germany or the US

Among wealthy nations with similar prosperity levels, per capita emissions vary significantly because of energy mix choices.

France, the UK, and Portugal have much lower per capita emissions than Germany, the Netherlands, or the US, largely because a higher share of their electricity comes from nuclear and renewable sources rather than fossil fuels.

Key Takeaways: Responsibility Is Shared but Unequal

- Global emissions exceed 35 Bt/yr and haven't peaked despite slowing growth. China is the largest annual emitter, but its per capita emissions remain below the US. Historical responsibility is dominated by Europe and the US (>90% in 1900, <33% today). Massive per capita gaps of 150x persist between the richest nations and the poorest (Sub-Saharan Africa). Energy policy and technology choices can decouple prosperity from emissions (e.g., UK/France vs. US).
