Key Takeaways

Ultra Sound Money Thesis Intact but Gas Activity Is the Critical Variable

- 1 ETH is currently slightly inflationary at **+0.83%/yr** due to historically low gas (avg 0.1 Gwei), with burns offsetting only ~1% of issuance
- 2 Burn mechanism works but requires sustained on-chain activity **low gas = low burn**
- 3 38.9M ETH staked (**32% of supply**) creates significant supply lock with validators earning ~2.7% APR
- 4 Long-term equilibrium at **125.7M ETH** is structurally sound but requires on-chain activity recovery
- 5 Flipping progress and **\$307B+ TVS** demonstrate growing but still early monetary premium

The Ultra Sound Money thesis remains valid — on-chain activity recovery is the key variable.
