

Ultra Sound Money

Ethereum's Post-Merge Supply Dynamics & Monetary Premium

Current Supply

121,603,980 ETH

Total supply

ETH Price

\$2,243

Spot price

Base Gas

0.1 G

Average block

Audience: crypto-native investors & Ethereum ecosystem participants evaluating ETH as a monetary asset

Source: ultrasound.money

ETH Supply Growing at +0.83%/Year with Only 192 ETH Burned in 7 Days

Current Supply

121,603,980 ETH

Total supply

Net Change (7D)

+19,445.89 ETH

Annualized: +0.83%/yr

Issuance Offset

0.01x

Burn offsets ~1%

7-Day Supply Change: Issuance vs Burn (ETH)

What this means

- Issued: 19,638.89 ETH
- Burned: 192.3 ETH
- Net: +19,445.89 ETH
- Burns offset only ~1% of issuance
- Result: supply continues to grow

Base Gas at Historic Lows: 0.1 Gwei Average Suppresses Fee Burn

Base Gas (Avg)

0.1 Gwei

7D avg; historic lows

Gas Range (7D)

0.0 → 1.3 Gwei

Min to max

Blob Fee Burn

0.15 ETH

Avg blob gas: 7

Gas Market (7D): min / avg / max

Avg 0.1 Gwei

Mechanics

- EIP-1559 burn
- Low base fee
- Blob fees (EIP-4844) negligible
- Today: low act supply inflation

Context: 0.0–0.01 ETH burns per block recently; 7D burn record was 0.07 ETH in a block.

DeFi and ETH Transfers Account for 85% of Weekly Fee Burn

Burn Categories (7D, ETH)

Leaderboard

Top burners

- ETH transfers
- Tether (USDT)

Category totals

- DeFi: 31 ETH
- ETH transfers
- NFTs: 3 ETH
- Contract creat

Total (7D): ~192

38.9M ETH Staked at 2.7% Issuance Rewards with Minimal Tips and MEV

Supply lock & participation

- 38.9M ETH staked (~32% of supply)
- 9.1M ETH locked in staking contracts
- Average lock span: 10.7 years
- Validator rewards dominated by issuance

Reward composition (APR)

Issuance vs burn (normalized)

- PoS issuance: ~2,800 ETH/day
- Fee burn (assumption): ~2,200

Interpretation

- Staking locks supply and earns
- Burn is the counter-force — but
- Current low-gas regime reduces

Long-Term Equilibrium Projected at 125.7M ETH with 1,037K ETH/Year Issuance-Burn Balance

Modeled supply trajectory (200 years)

Projection parameters

- Staked: 39M ETH
- Base gas assumption: 100M gas
- PoS issuance: 1.037M ETH/year
- Burn: ~2.2K ETH/block
- Equilibrium: ~125.7M ETH
- Target supply: 125.7M ETH

Historical era transition

ETH at 18.7% of Bitcoin's Market Cap, Securing \$272B in Native Value

ETH market cap ratio

Bitcoin: 18.70%

USD: 1.30%

Gold: 0.89%

Total Value Secured (TVS)

ETH (native): \$272.76B

ERC20s: \$22.21B

NFTs: \$12.66B

Key Takeaways: Ultra Sound Money Thesis Intact but Gas Activity Is the Critical Variable

What the data says

- Today ETH is mildly inflationary: +0.83%/year, because avg base gas is ~0.1 Gwei and burns offset (7D)
- The burn mechanism works — but requires sustained on-chain activity (gas) to materially offset issuance
- Staking is a meaningful scarcity engine: 38.9M ETH staked (~32% of supply); validator rewards are ~5% (APR) with minimal tips/MEV (0.1% + 0.1%)
- Long-term model converges toward ~125.7M ETH equilibrium (assumes 39M staked and 22 Gwei avg base gas; issuance/burn balance ~1,037K ETH/year)
- Monetary premium is real but early: ETH is 18.7% of BTC market cap and secures ~\$307.6B total value
