ETH Supply Growing at +0.83%/Year with Only 192 ETH Burned in 7 Days

Current Supply: 121,603,980 ETH
7D Net Change: +19,445.89 ETH
Annualized: +0.83%/year
Issued: +19,638.29 ETH
Burned: -192.39 ETH
Offset Ratio: 0.01x
Burns currently offset only ~1% of issuance.

Base Gas at Historic Lows: 0.1 Gwei Average Suppresses Fee Burn

EIP-1559 burns the base fee in each block.

7D gas: min 0.0 Gwei · max 1.3 · avg 0.1.

Blob gas (EIP-4844): avg 7,144,934 wei; only 0.15 ETH burned

Long-term projection assumes 22 Gwei — far above today.

Low gas → low burn → temporary supply inflation.

Key Takeaways: Ultra Sound Money Thesis Intact but Gas Activity Is the Critical Variable

- ETH is currently mildly inflationary (+0.83%/yr) because gas is at historic lows (avg 0.1 Gwei).
- EIP-1559 works mechanically, but burn requires sustained on-chain activity; 7D burn was only ~192 ETH.
- Staking locks a large supply base: 38.9M ETH staked; 9.1M ETH locked ~10.7 years avg.
- Long-run model converges to ~125.7M ETH equilibrium (assumes 39M staked, 22 Gwei base gas).
- Monetary premium is building: ETH is 18.7% of BTC market cap and secures ~\$307.6B TVS.
- Headwind to watch: low activity → low burn → supply drift upward until gas recovers.
