Room to Grow

More than half of pages still risk **Flash of Invisible Text (FOIT)** during web font loading. The `font-display` CSS property controls how fonts render before download completes.

Key Takeaways: Bigger Pages, Smarter Protocols, Stronger Security

- 1 Page weight keeps climbing** — Median desktop pages now transfer ~2,000 KB, roughly 25% heavier than in 2020, driven by richer media and JavaScript.
- 2 HTTPS is the new baseline** — At 99%+ of requests, unencrypted HTTP is essentially extinct on the modern web.
- 3 HTTP/3 is the fastest-growing protocol metric** — From near-zero to ~40% support in under four years, rapidly becoming mainstream.
- 4 Fewer TCP connections despite more requests** — Multiplexing in HTTP/2 and HTTP/3 has cut median connections per page by 15—27%.
- 5 Font-display still underused** — At ~40—42% adoption, there is significant room for improvement in avoiding invisible text during font loading.
